

# Stamped Concrete/Stamp Overlay

## Stamped Concrete

A pattern is impressed into freshly poured concrete. Many colors and patterns are available that can simulate stone, tile, brick, wood, etc. Stamped concrete is often used on drives, walks, pool decks, patios, porches or entries. All of our concrete is 3500 psi.+ and steel reinforced.

## Stamp Overlay

Stamp overlay is a co-polymer modified cement based material that is designed to replicate the look of stamped concrete where concrete already exists. This makes it possible for people who already have concrete to enjoy the look of stamped concrete without the mess, hassle and potential trauma to adjoining areas due to removal of existing concrete.

One practical use for stamped overlay is when enlarging a patio with the desired end result to be decorative. We pour the extension with a simple broom finish. We then stamp overlay all of the concrete, new and old. After the material has dried we can then apply a number of highlighting colors to achieve a natural variegated look. We then seal the material with 2 coats of solvent based clear sealer with a non-skid finish.
